

HOW TO USE: KNOCK-IN END CAPS

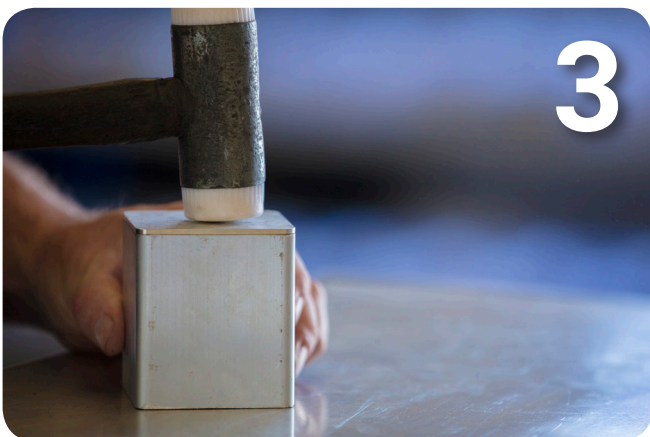

Nelsons CNC end caps are an aluminium knock-in end cap solely designed to fit in the end of an extrusion with a tight fit, without needing any weld or adhesive. Our caps are all made on our high quality CNC machining centres, ensuring a precision fit. We stock over 100 different cap sizes and specialise in designing caps to fit new extrusions everyday.

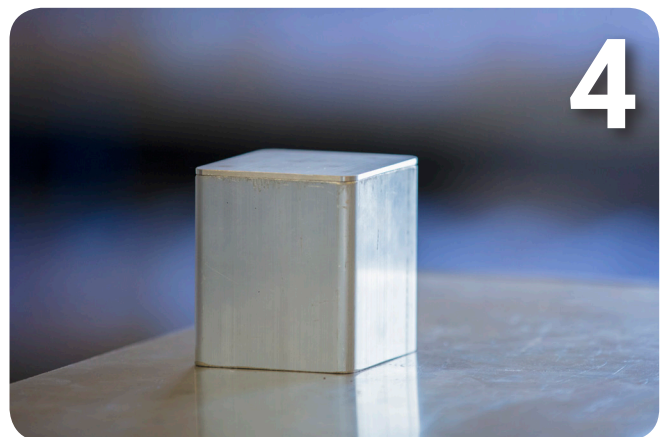

Locate the bevelled edge to seat position of your end cap.

Place your end cap on top of the extrusion.

Simply knock your end cap in with rubber mallet firmly until fitted.

No welding required.
